On-going Study Data Sources

In exploring this issue, Dr. Vana has become aware of several potential databases facilitating health system investigation and has proceeded to pursue these questions. The Rhode Island Consortium for Autism Research and Treatment (RI-CART) is a collaboration between local academic institutions, clinics and service providers, and family and patient organizations. Since 2013, RI-CART has been developing a statewide research registry in order to facilitate research participation for interested participants and their families. In addition to consulting this data source, Dr. Vana also plans to analyze the data types of claims from the RI state Medicaid case as well as the Rhode Island Hospital and Hasbro Children’s Hospital Emergency Services databases where these patients often present for evaluation.

Future Questions

While these cases may be compelling, consulting the large databases described above will help us to understand how prevalent this problem is in Rhode Island. Additionally it is important to think more about how the systems facilitate or complicate the transition between DCYF and BHHDD. Successful interventions for this population will require collaboration among many partners: police, child psychiatry, emergency psychiatry, schools, child protective services, homeless shelters and supported housing resources. A special thanks to Todd Levine MD and Margaret Klitzke MD who helped Dr. Vana explore this topic in Rhode Island.
